

The Canon Enterprise

For over a half-century, Canon Inc. has been a leading worldwide provider of imaging and information-processing solutions. The company produces still and video cameras, laser and color printers, copiers, computers and fax machines, providing a complete range of office automation solutions. Nearly every business office in the world contains at least one Canon product, and publishing environments usually include several. With its diversified product line and worldwide distribution network, Canon is uniquely placed to deliver client-server publishing solutions throughout an entire enterprise. Through its different divisions, Canon provides R & D, sales, and marketing organizations, and widespread, global distribution channels for its many products. Canon's initial investor partnership with NeXT is being reinforced by the company's decision to build computers optimized for NEXTSTEP.

CCSI (Canon Computer System Inc.), the microcomputer division of Canon USA, and its ATO (Advanced Technologies Operation), is building a high-end Intel-based computer workstation – called the object.station – that is based on original NeXT specifications and specifically designed to run NEXTSTEP. When combined with popular Canon peripheral devices such as laser printers, high volume departmental printers like the GP 55, CLC 350/550 and A1 Bubblejet color printers, fax machines, scanners, and copiers, the Canon object.station offers enterprise publishers a compelling platform for next-generation document **Canon object.station** processing that is unmatched by any other vendor.
