

# Tailor

Graphical PostScript Editing Application for NEXTSTEP™

TAILOR is an essential application for publishing and page layout tasks. TAILOR can edit any PostScript (PS and EPS) document, including multi-page PostScript files imported from MS Windows or Macintosh platforms. TAILOR can move, reshape, or delete all types of graphic objects, such as line art, text and pixel images. It can recolor, modify or add line art; alter typefaces; add or modify text; and regroup text lines into paragraphs for more flexible editing. TAILOR can then save the results back into a PostScript file or use the standard copy and paste functions to place them in any NEXTSTEP application.

Unlike other "universal" document management systems, which require you to "convert" your documents into a file type only viewable, and changeable with yet another application, TAILOR allows you to open and edit your existing PostScript files, while preserving their use with many current PostScript applications. Even if your application doesn't export PostScript directly, most platforms will allow you to generate PostScript by printing/saving to disk. Word processors, spreadsheet and database files can all be viewed and edited in this manner. Additional programs are not required to take advantage of opening so many different files across a shared network, from any platform, from any application.

## Multi-Page Support

- Open multi-page PostScript documents.
- Browse through their pages.

- Extract any part of any page for pasting in another application.
- Edit any part of any page and save or paste the result separately.
- Save and print multi-page documents.

## PostScript Input and Construction

- Retain embedded font definitions as line-work where appropriate.
- Retain named colors and separation colors.
- Reconstruct text paragraph features.
- Optimize input of PostScript from widely used applications.

## Editing

- Undo capability.
- Create and edit paths, including bezier control points.
- Enter numeric position and size.
- Retain structuring information (grouping) in the saved document.

Requires NEXTSTEP Release 3.1 or higher. Now shipping in Multi-Architecture Binary (MAB) format.
